# **Functions**

Introduction to R for Public Health Researchers

This is a brief introduction. The syntax is:

Then you would run the 4 lines of the code, which adds it to your workspace.

Here we will write a function that returns the second element of a vector:

```
return2 = function(x) {
  return(x[2])
}
return2(c(1,4,5,76))
[1] 4
```

Note that your function will automatically return the last line of code run:

```
return2a = function(x) {
   x[2]
}
return2a(c(1,4,5,76))
[1] 4
```

And if your function is really one line or evaluation, like here, you do not need the curly brackets, and you can put everything on one line:

```
return2b = function(x) x[2]
return2b(c(1,4,5,76))
```

Also note that functions can take multiple inputs. Maybe you want users to select which element to extract

```
return2c = function(x,n) x[n]
return2c(c(1,4,5,76), 3) [1] 5
```

#### Writing a simple function

Let's write a function, sqdif, that:

- 1. takes two numbers x and y with default values of 2 and 3.
- 2. takes the difference
- 3. squares this difference
- 4. then returns the final value

# Writing a simple function

```
sqdif <- function(x=2,y=3) {
          (x-y)^2
}
sqdif()

[1] 1
sqdif(x=10,y=5)

[1] 25
sqdif(10,5)</pre>
```

Try to write a function called top() that takes a matrix or data.frame, and returns the first n rows and columns, with the default value of n=5.

Try to write a function called top() that takes a matrix or data.frame, and returns the first n rows and columns

#### Custom functions in apply

You can also designate functions "on the fly"

### Simple apply

sapply() is a user-friendly version and wrapper of lapply by default returning a vector, matrix, or array

```
sapply(matList, dim)

[1,] 5 5
[2,] 5 5

sapply(matList, class)

"matrix" "matrix"
```

```
myList = list(a=1:10, b=c(2,4,5), c = c("a","b","c"),
                d = factor(c("boy", "girl", "girl")))
tmp = lapply(myList, function(x) x[1])
tmp
$a
[1] 1
$b
[1] 2
$C
[1] "a"
$d
[1] boy
Levels: boy girl
sapply(tmp, class)
  "integer" "numeric" "character" "factor"
```

#### sapply can also be applied to columns of data frames

```
library (readr)
circ = read csv(paste0("http://johnmuschelli.com/intro to r/",
  "data/Charm City Circulator Ridership.csv"))
sapply(circ, class)
                                    orangeBoardings orangeAlightings
             day
                              date
                      "character"
     "character"
                                          "integer"
                                                            "integer"
   orangeAverage
                  purpleBoardings purpleAlightings purpleAverage
                                                            "numeric"
       "numeric"
                         "integer"
                                          "integer"
  greenBoardings
                  greenAlightings
                                       greenAverage bannerBoardings
       "integer"
                        "integer"
                                          "numeric"
                                                            "integer"
bannerAlightings
                    bannerAverage
                                              daily
                         "numeric"
                                          "numeric"
       "integer"
```
